Understanding Alprazolam

Alprazolam belongs to a class of medications known as **benzodiazepines**, which act on the brain and nerves (central nervous system) to produce a calming effect. It enhances the effects of a natural chemical in the body called GABA, helping to reduce tension, restlessness, and feelings of panic.

Doctors often prescribe Alprazolam for:

- **Generalized Anxiety Disorder (GAD)** – to control persistent worry and nervousness.
 - **Panic Disorder** – to reduce sudden panic attacks or fear episodes.
 - **Short-term Stress Relief** – for patients experiencing acute anxiety.
